Abstract

At many universities, each department maintains a independent cluster. Many of these clusters run under utilized. In this paper we will describe a framework and technologies that where used to link departmental clusters such that submission at one cluster could lead to execution on another. This framework is then further expanded to operating on a production national grid.

1 Introduction

The problem we have solved

- Department clusters waste power by being under utilized significant portions of time.
- Researchers have peaks in usage (think paper writing) and need overflow capacity.
- Overflow capacity for their local cluster.

Why the problem is not already solved or other solutions are ineffective in one or more important ways

- A common solution to linking clusters is condor flocking. Flocking requires every cluster to run condor daemons on their nodes.
- Another solution is single vendor/software solution. This again requires buy-in from all departments on campus.
- Placing globus gatekeepers on each cluster would allow jobs to be submitted to each cluster without modifying the underlying batch system. But, this would require a higher layer of abstraction over the globus gatekeepers to optimally balance load between clusters. Also, it does not provide a method for transparent execution on other clusters.

Why our solution is worth considering and why is it effective in some way that others are not

- The framework described in this paper is designed as a modular framework that will allow clusters overflow onto each other and to the grid. This framework requires running condor on only one node in the cluster. Each job that comes from another cluster will go through the default scheduler, whether it's PBS, SGE, or LSF.

How the rest of the paper is structured

- The short statement below is often all you need, but you should change it when your paper has a different structure, or when more information is *required* to describe what a given section contains. If it isn't *required* then you don't want to say it here.

The rest of this paper first discusses related work in Section 2, and then describes our implementation in Section 3. Section 4 describes how we evaluated our system and presents the results. Section 5 presents our conclusions and describes future work.

2 Related Work

Other efforts that exist to solve this problem and why are they less effective than our method

- Globus is a translation layer between the globus specific Resource Specification Language, and the local resource manager. It has been very successful in that it has a large install base. Globus also has deep integration with standard grid credentials.
- Condor Flocking

Other efforts that exist to solve related problems that are relevant, how are they relevant, and why are they less effective than our solution for this problem

- Diagrid
- GlideinWMS
- Panda

3 Implementation

What we (will do | did): *Our Solution*

- Glideins
- Flocking
- Condor & BLAHP

How our solution (will | does) work

- Works on firefly

4 Evaluation

How we tested our solution

- Production jobs on Firefly
- Faster job submission and start than globus. Should be easy to tell.
- What the results *do* and *do not* say

5 Conclusions and Future Work

The problem we have solved

- The most succinct statement of the problem in the paper. Ideally one sentence. More realistically two or three. Remember that you simply state it without argument. If you have written a good paper you are simply reminding the reader of what they now believe and of how much they agree with you.

Our solution to the problem

- Again, the succinct statement that you have presented a solution
- Sometimes it works well to leave it at that and not even describe your solution here. If you do, then again state your solution in one or two sentences taking the rhetorical stance that this is all obvious. If you have a good solution and have written an effective paper, then the reader already agrees with you.

Why our solution is worthwhile in some significant way

- Again, a succinct restatement in just a few sentences of why your solution is worthwhile assuming the reader already agrees with you

Why the reader should be impressed and/or pleased to have read the paper

- A few sentences about why your solution is valuable, and thus why the reader should be glad to have read the paper and why they should be glad you did this work.

What we will (or could) do next

- Improve our solution
- Apply our solution to harder or more realistic versions of this problem
- Apply our solution or a related solution to a related problem
